PDF-to-Excel Transformation Workflow

This project demonstrates how a 10-page semi-structured emergency call report was transformed into a clean, structured, and validated Excel workbook using Python and Microsoft Excel.

Workflow

1. Reviewed the structure of the 10-page semi-structured PDF report.
2. Extracted and structured 69 records from the original report and identified 19 data fields.
3. Cleaned fragmented and inconsistent values using Python.
4. Matched and organized records through unique Log IDs.
5. Structured the output in Microsoft Excel.
6. Checked record counts, duplicate IDs, and required fields.
7. Created a privacy-safe portfolio sample using synthetic data.

Results and Deliverables

Results

- 69 records were extracted and structured from the original 10-page PDF report.
- 19 data fields were standardized for tabular use.
- 20 synthetic records were created for the public portfolio sample.
- 20 unique Log IDs were validated.
- 0 duplicate Log IDs were identified.
- 0 required fields were missing, excluding optional PSAP and Comments fields.
- Personally identifiable information was removed from the portfolio version.

Deliverables

- Structured Excel dataset
- Project summary sheet
- Quality control sheet
- Privacy-safe source-style PDF sample
